Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

An image recording and Claim 1 (currently amended): 1 reproducing apparatus for recording and reproducing a multiple 2 picture signal obtained by multiplexing picture signals from a 3 plurality of cameras via a frame switcher such that said 4 multiple picture signal is comprised of a series of frames 5 alternating between said plurality of cameras, said image 6 recording and reproducing apparatus having a skip-reproduction 7 feature for alternating skipping of n frames of said multiple 8 picture signal and continuous reproduction of m frames of said 9 multiple picture signal wherein n is a positive integer, and m 10 is a positive integer related to a frame switching pattern, 11 wherein said apparatus skips said frames without reading the 12 contents of the multiple picture signal. 13

Claim 2 (previously presented): The image recording and 1 reproducing apparatus according to claim 1, wherein said 2 number of frames to be skipped is changed during skip 3 reproduction. 4

Claim 3 (original): The image recording and reproducing

2 apparatus according to claim 2, wherein said number of frames

are changed to (n-d) (2 \leq d<n, d is a positive integer) in case

4 said number of frames is decreased.

1 Claim 4 (original): The image recording and reproducing

2 apparatus according to claim 1, wherein at least m frames are

3 continuously reproduced at the end of a reconstructed image.

1 Claim 5 (original): The image recording and reproducing

2 apparatus according to claim 1, wherein at least m frames are

3 continuously reproduced at the beginning of a reproduction

4 image.

3

5

6

2

1 Claim 6 (previously presented): The image recording and

2 reproducing apparatus according to claim 1, wherein said skip-

reproduction feature is implemented by a process including a

4 skip processing step for recognizing said frames and a

reproduction processing step for performing reproduction and

output of said frames.

1 Claim 7. (previously presented): The image recording and

reproducing apparatus according to claim 6, wherein said skip-

3 reproduction feature is implemented by a skipping of n frames

4 and a subsequent reproduction of m frames.

Claim 8 (previously presented): The image recording and

2 reproducing apparatus according to claim 6, wherein said skip-

reproduction feature is implemented by a forward skipping of a

series of (n+m) frames, a reverse skipping of m frames, and a

5 reproduction of m frames.

3

4

3

4

7

2

3

4

Claim 9 (currently amended): The image recording and

2 reproducing apparatus according to claim 7, wherein said

subsequent reproduction of a reconstructed image is performed

on m frames up to a final frame of the reconstructed image

5 when the difference between a frame just before start of said

6 skipping and the final frame of the reconstructed image is

equal to or greater than m frames and smaller than or equal to

8 (n+m) frames.

1 Claim 10 (previously presented): The image recording and

reproducing apparatus according to claim 7, wherein said

reproduction is performed up to a final frame of a

reconstructed image when the difference between a frame of the

5 reconstructed image just before start of said skipping and the

6 final frame of the reconstructed image is smaller than m

7 frames.

Claim 11 (previously presented): The image recording and 1 reproducing apparatus according to claim 8, wherein reverse 2 skipping of a maximum of m frames is performed within the 3 in the immediately preceding number of skipped frames 4 processing, when a final frame of an image is reached during 5 said skipping. 6

Claim 12 (original): The image recording and reproducing apparatus according to claim 7, wherein adjustment is made to set the remaining number of frames to a multiple of (n+m) at start of said skip reproduction feature and when the number of frames n to be skipped is changed during skip reproduction.

Claim 13 (previously presented): The image recording and reproducing apparatus according to claim 8, wherein adjustment is made to set a remaining number of frames to a multiple of (n+m) at start of said skip reproduction feature and when the number of frames n to be skipped is changed during skip reproduction.

Claim 14 (original): The image recording and reproducing
apparatus according to claim 1, wherein reproduction is
suspended after continuous reproduction of said predetermined
m frames when suspension of reproduction is instructed during
execution of said skip reproduction feature.

Claim 15 (currently amended): An image reproducing 1 apparatus for reproducing a multiple picture signal obtained 2 by multiplexing picture signals from a plurality of cameras 3 via a frame switcher such that said multiple picture signal is 4 comprised of a series of frames alternating between said 5 6 plurality of cameras, said image reproducing apparatus having a skip-reproduction feature for alternating skipping of n 7 said multiple picture signal and continuous frames of 8 reproduction of m frames of said multiple picture signal, 9 wherein n is a positive integer, and m is a positive integer 10 related to a frame switching pattern, wherein said apparatus 11 12 skips said frames without reading the contents of the multiple picture signal. 13

- Claim 16 (previously presented): An image reproducing
 method for skip reproducing a multiple picture signal obtained
 by multiplexing picture signals from a plurality of cameras
 via a frame switcher such that said multiple picture signal is
 comprised of a series of frames alternating between said
 plurality of cameras, said image reproducing method comprising
 the steps of:
- skipping n frames of said multiple picture signal;
- 9 continuously reproducing m frames of said multiple 10 picture signal, wherein n is a positive integer, and m is a 11 positive integer; and

- repeating said skipping and continuous reproducing.
- 1 Claim 17 (previously presented): An image reproducing
- 2 method for skip reproducing a multiple picture signal obtained
- 3 by multiplexing picture signals from a plurality of cameras
- 4 via a frame switcher, said image reproducing method comprising
- 5 the steps of:
- forward skipping n+m frames of said multiple picture
- 7 signal, then reverse skipping m frames of said multiple
- 8 picture signal, and then continuous reproducing m frames of
- 9 said multiple picture signal; and
- repeating said skipping, reverse skipping and continuous
- 11 reproducing, wherein
- n is a positive integer, and m is a positive integer.
